

# **PsyAnalyser**

*Release 0.0.1*

**Sofiia Myntiuk**

May 19, 2020

<b>Python Module Index</b>	<b>9</b>
<b>Index</b>	<b>11</b>

The main module of the program. Contains analysis of data from databases and API.

`modules.analysis.analyse_students_merge ( path, ukrainian )`  
str, list -> plotly line graphs Merges data from API and data from databases to analyse students' depression, doctor and suicide parameters.

`modules.analysis.analyse_suicide_by_age ( path )`  
str -> plotly line graphs Analyses middle death from suicide age in different years.

`modules.analysis.analyse_ukrainian ( ukrainian_analyser )`  
PsyStudentAnalyser -> plotly diagrams. Returns pie and line diagrams for possible parameters of ukrainian students.

`modules.analysis.analyser_ukrainian_students ( ukrainian )`  
list -> PsyStudentAnalyser Returns Analyser to analyse Ukrainian students mental health.

`modules.analysis.count_resp ( data )`  
dict -> dict Counts sum of respondents in particular year.

`modules.analysis.create_web ( )`  
Creates and returns web application to run.

`modules.analysis.get_countries_data ( path_percent, path_total, col )`  
str, str, str -> plotly diagram Returns line diagram based on files that contain name of the country, percent of people suffering from d/o's and total population of the country for every year.

`modules.analysis.get_from_google_sheets ( sheets )`  
list -> list Returns list of responses from all the workplaces listed.

Contains implementation of Person, Student and Student classes. Student is inherited from Person,

**class** `modules.people.Person ( age, depression=0, suicide=0, anxiety=0, doctor=0 )`  
Representation of the Person. The class is needed to work with AgeGroup class.

**property age**  
(Person) -> int Returns age of the person.  
**Returns** \_\_age parameter.

**property anxiety**  
(Person) -> bool Returns 1 if person have anxiety disorders and 0 otherwise. :return: \_\_anxiety

parameter.

**property depression**

(AgeGroup) -> int Returns 1 if person have depressive disorders and 0 otherwise. :return: \_\_depression parameter.

**property doctor**

(Person) -> int Returns 1 if Person visited a doctor and 0 otherwise.

**Returns** \_\_doctor parameter.

**property suicide**

(Person) -> bool Returns 1 if person had suicide attempts and 0 otherwise.

**Returns** \_\_suicide parameter.

**class** modules.people.**Student** ( age, depression=0, anxiety=0, suicide=0, doctor=0, study=0, suicidal\_thoughts=0, self\_harm=0, dep\_diagnosed=0, behavior=0, anx\_diagnosed=0, list\_dep=[], list\_anx=[] )

Representation of the Student, who is Person, but has additional parameters.

**property anx\_diagnosed**

(Student) -> int Returns True if student have diagnosed anxiety disorder and False otherwise.

**Returns** \_\_anx\_diagnosed parameter.

**property behavior**

(Student) -> int Returns True if student have changed their plans or (and) behavior because of anxiety and False otherwise.

**Returns** \_\_behavior parameter.

**property dep\_diagnosed**

(StudentGroup) -> int Returns True if student have diagnosed depressive disorder and False otherwise.

**Returns** \_\_dep\_diagnosed parameter.

**property self\_harm**

(Student) -> int Returns True if student practiced self-harm and False otherwise.

**Returns** \_\_self\_harm parameter.

**property study**

(Student) -> int Returns True if student assume that study decreased level of their mental health and False otherwise.

**Returns** \_\_study parameter.

**property suicidal\_thoughts**

(Student) -> int Returns 1 if student had suicidal thoughts and 0 otherwise.

**Returns** \_\_suicidal\_thoughts parameter.

**property suicide**

(Student) -> int Returns True if student had suicide attempts and False otherwise.

**Returns** \_\_suicide parameter.

modules.people.**test\_input** ( value )

int -> int Returns value if it is correct and 0 otherwise. :param value: value to check. :param value:

:return:

Contains implementation of AgeGroup class.

```
class modules.agegroup.AgeGroup ( age=0, suicide=0, suicide_resp=0, depression=0, depression_resp=0,
anxiety=0, anxiety_resp=0 )
```

Represents age group. Every age group contains age (years) and counters for suicides, depression and anxiety disorders that people of this age have. For every of described parameter there are number of respondents that took part in questionnaire, if needed.

```
add_person ( person )
```

(AgeGroup, Person) -> NoneType Adds person parameters to parameters of the group.

**Parameters** **person** – person to add to group.

**Returns**

```
property age
```

(AgeGroup) -> int Returns age parameter of the AgeGroup object.

```
property anxiety
```

(AgeGroup) -> int Returns number of people in AgeGroup suffering from anxiety disorders.

:return: \_\_anxiety parameter.

```
property anxiety_resp
```

(AgeGroup) -> int Returns number of total number of respondents to anxiety questionnaire in AgeGroup. :return: \_\_anxiety\_resp parameter.

```
property depression
```

(AgeGroup) -> int Returns number of people in AgeGroup suffering from depression. :return: \_\_depression parameter.

```
property depression_resp
```

(AgeGroup) -> int Returns number of total number of respondents to depression questionnaire in AgeGroup. :return: \_\_depression\_resp parameter.

```
merge ( other )
```

(AgeGroup, AgeGroup) -> 0 Merges two AgeGroup objects by summarizing parameters' values to self. :param other: AgeGroup to merge with. :return:

```
property suicide
```

(AgeGroup) -> int Returns number of suicides committed by AgeGroup. :return: \_\_suicide parameter.

```
property suicide_resp
```

(AgeGroup) -> int Returns number of total number of respondents to suicide questionnaire in AgeGroup. :return: \_\_suicide\_resp parameter.

```
modules.agegroup.test_input ( value )
```

int -> int Returns value if it is correct and 0 otherwise. :param value: value to check.

Contains implementation of StudentGroup class. StudentGroup class is inherited from AgeGroup.

```
class modules.studentgroup.StudentGroup ( age, depression=0, anxiety=0, suicide=0, study=0,
suicidal_thoughts=0, self_harm=0, dep_diagnosed=0, behavior=0, anx_diagnosed=0, doctor=0, total=0, list_dep=[],
list_anx=[] )
```

Representation of StudentGroup, which is AgeGroup, but has additional parameters.

**add\_person** ( *person* )

(StudentGroup, Person) -> NoneType :return:

**property anx\_diagnosed**

(StudentGroup) -> int Returns number of students who have diagnosed anxiety disorder.

**Returns** \_\_anx\_diagnosed parameter.

**property behavior**

(StudentGroup) -> int Returns number of students who have changed their plans or (and) behavior because of anxiety.

**Returns** \_\_behavior parameter.

**property dep\_diagnosed**

(StudentGroup) -> int Returns number of students who have diagnosed depressive disorder.

**Returns** \_\_dep\_diagnosed parameter.

**property doctor**

(StudentGroup) -> int Returns number of students who have visited a doctor.

**Returns** \_\_doctor parameter.

**merge** ( *other* )

StudentGroup, StudentGroup -> NoneType Merges two AgeGroup objects by summarizing parameters' values to self. :param other: AgeGroup to merge with. :return:

**property self\_harm**

(StudentGroup) -> int Returns number of students who practiced self-harm.

**Returns** \_\_self\_harm parameter.

**property study**

(StudentGroup) -> int Returns number of students who assume that study decreased level of their mental health.

**Returns** \_\_study parameter.

**property suicidal\_thoughts**

(StudentGroup) -> int Returns number of students who had suicidal\_thoughts.

**Returns** \_\_suicidal\_thoughts parameter.

**property suicide**

(StudentGroup) -> int Returns number of students who had suicide attempts.

**Returns** \_\_suicide parameter.

**property total**

(StudentGroup) -> int Returns total number of students.

**Returns** \_\_total parameter.

Contains implementation of PsyAnalyser class. It simplifies work with AgeGroup and StudentGroup objects.

**class** modules.pyanalyser.**PsyAnalyser** ( *year=None* )

Representation of PsyAnalyser.

**add\_group ( group )**

(Analyser, AgeGroup) -> NoneType Adds group to dictionary of groups, so that its structure is age: AgeGroup. If group of given age already exists, it changes it.

**Parameters** **group** – age group to add to the dictionary.

**Returns**

**add\_person ( person )**

(Analyser, Person) -> NoneType Adds person to dictionary by adding their parameters to the corresponding dictionary value. If such an AgeGroup doesn't exist, creates new AgeGroup based on the person.

**Parameters** **person** – Person object to add.

**Returns**

**get\_anxiety ( )**

PsyAnalyser -> ResponseList Returns percents of people suffering from anxiety d/o in each age group.

**get\_depression ( )**

PsyAnalyser -> ResponseList Returns percents of people suffering from depressive d/o in each age group.

**get\_suicide ( )**

PsyAnalyser -> ResponseList Returns percents of people who had suicide attempts in each age group.

**property groups**

(Analyser) -> dict Returns groups from the PsyAnalyser object

**Returns** value of \_\_groups parameter

Contains implementation of Analyser class, which is inherited from PsyAnalyser class. It simplifies work with StudentGroup objects.

**class modules.psystudentanalyser.PsyStudentAnalyser**

Student Analyser representation. Is Analyser, but with wider options.

**add\_person ( person )**

(Analyser, Person) -> NoneType Adds person to dictionary by adding their parameters to the corresponding dictionary value. If such an StudentGroup doesn't exist, creates a new one based on the person.

**Parameters** **person** – Person object to add.

**Returns**

**get\_anx\_diagnosed ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who have been diagnosed with anxiety d/o.

**get\_anxiety ( )**

PsyAnalyser -> ResponseList Returns percents of people suffering from anxiety d/o in each age group.

**get\_behavior ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who have changed their behavior

and/or plans because of anxiety.

**get\_dep\_diagnosed ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who have been diagnosed with depressive d/o.

**get\_depression ( )**

PsyAnalyser -> ResponseList Returns percents of people suffering from depressive d/o in each age group.

**get\_doctor ( )**

PsyAnalyser, bool -> ResponseList Returns percents of people who had visited a therapist in each age group.

**get\_list\_anx ( )**

PsyAnalyser -> ResponseList Returns prevalence of each anxiety d/o.

**get\_list\_dep ( )**

PsyAnalyser -> ResponseList Returns prevalence of each depressive d/o.

**get\_self\_harm ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who practice(d) self-harm.

**get\_study ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who think studying negatively affected their mental health.

**get\_suicidal\_thoughts ( )**

PsyAnalyser, bool -> ResponseList Returns percent of people who had/have suicidal thoughts.

**get\_suicide ( )**

PsyAnalyser -> ResponseList Returns percents of people who had suicide attempts in each age group.

Contains implementation of ResponseList ADT and Response class.

**class modules.responselist.Response ( x=0, y=0 )**

Representation of the Response, which is a pair of numbers. The first number is value of x and the second one is value of y, so that data is ready to be plotted.

**get\_df\_for\_pie ( )**

Response -> list Returns data from Response so that it can easily be turned into a pandas data frame to plot pie diagram.

**property value\_x**

Response -> int/str Returns value of value\_x parameter.

**property value\_y**

Response -> int/float Returns value of value\_y parameter.

**class modules.responselist.ResponseList**

ResponseList ADT implementation based on linked list.

**get\_df\_for\_line ( year=None )**

ResponseList -> list Returns data from ResponseList so that it can easily be turned into a pandas

data frame to plot line graph.

**property head**

ResponseList -> Response :return: \_head value.
